

Computer Graphics Mini Project Report

Title

Boat Animation Using Computer Graphics in Turbo C

Abstract

This project demonstrates a simple Boat Animation using Computer Graphics in Turbo C with graphics.h. It uses line, floodfill, setcolor, setfillstyle and delay functions to animate a boat moving across water.

Introduction

Computer Graphics deals with creating and displaying images using computers. This project demonstrates a moving boat using basic graphics primitives and animation.

Objectives

- Learn graphics.h
- Create 2D animation
- Understand graphics functions
- Improve C programming skills.

Hardware Requirements

Computer, Intel i3+, 4GB RAM, Keyboard, Mouse

Software Requirements

Turbo C++, C Language, graphics.h, Windows

Algorithm

- 1.Initialize graphics
- 2.Draw water
- 3.Draw boat
- 4.Fill colors
- 5.Move boat in loop

- 6.Delay
- 7.Close graphics

Result

The boat animation executes successfully and moves across the screen.

Advantages

Easy to understand, demonstrates graphics concepts, useful for students.

Applications

Education, graphics learning, mini projects.

Future Enhancements

Add waves, birds, sun, keyboard controls, migrate to OpenGL.

Conclusion

The project successfully demonstrates 2D graphics and animation using Turbo C.
